                                                                              O
                      Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1254

New death domain containing receptor and recombinant vector optionally comprising leader sequence claim 6; Fig 3; SUpp; Japanese.

The invention provides nucleotide sequences encoding death domain containing receptor polypeptides DR3-V1 and DR3. The DR3-V1 cDNA clone is contained in ATCC deposition No. 97456 and the DR3 cDNA clone is contained in ATCC deposition No. 97757. Recombinant vectors comprising the nucleic acid sequences and optionally the leader sequences are used for the recombinant production of the proteins. The present sequence represents a cDNA encoding the death domain containing receptor polypeptide (DR3).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Problepetide(s) Apo-3 and Apo-2LI - useful for regulating apoptosis in mammalian cells
Example 1; Page 45-46; 70pp; English.
CCDNA clone FH20.57 (ATCC 55820) codes for a novel polypeptide (see CDNA clone FH20.57 (ATCC 55820) codes for a novel polypeptide (see CHAR clone FH20.57 (ATCC 55820) codes for a novel polypeptide (see CDNA clone FH20.57 (ATCC 55820) codes for a novel polypeptide (see CDNA clone FH20.57 (ATCC 55820) codes for a novel polypeptide (see CDNA clone FH20.57 (ATCC 55820) codes for a novel polypeptide (see TDIIS) and the mammalian cells. It was isolated from a human foetal CD activity in mammalian cells. It was isolated from a human foetal CD activity in mammalian cells. It was isolated from a human foetal CD activity in mammalian cells. It was isolated from a human foetal CD activity in mammalian cells actided to another novel apoptosis CD collect Polypeptide, Apo-3 are identical to another novel apoptosis CD produce recombinant Apo-3 polypeptides, especially the cacids 338-417). Apo-3 can be used to induce apoptosis or CD actides another actided the actided containing cells that the purposes. Non-human transgenic animals containing cells that colline that the produce actided and knockout animals containing cells that the produce actided act

This sequence encodes the human apoptosis inducing receptor (AIR) of the invention. AIR is a Type I transmembrane protein, soluble forms of which can be used to regulate cell death in a therapeutic setting. Soluble AIR can also be used in vitro to block apoptosis or AIR-expressing cells, or to screen agonists or antagonists of AIR activity. The cytoplasmic domain of AIR can be used to develop assays for inhibitors of AIR-induced cell death, which is useful to regulate cell death in a therapeutic setting as well as in vitro. Agonists of AIR activity can be used to kill tumour cells that express AIR, or T cells expressing AIR in autoimmune diseases. Sequence 1847 BP; 316 A; 605 C; 579 G; 347 T;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     망
              to treat inflammatory diseases

Claim 2; Page 71-73; 108pp; English.

This cDNA clone, deposited as ATCC 97456, codes for human death domain containing receptor DR3 VI (see W31516), a novel member of the tumour necrosis factor receptor family. It was isolated from a CDNA library derived from cells of a human testis tumour. Related death domain containing receptor DR3 cDNA (see T8942)) was isolated from a HUVEC cDNA library. The genes have also been identified in CDNA libraries of foetal lyre foetal brain, tonsil and leukocyte. Nucleic acids encoding full-length or mature DR3-VI can be used to produce recombinant polypeptides in transformed host cells. These polypeptides can be used to treat diseases and disorders associated with the inhibition of apoptosis. Antagonists, such as antibodies raised against DR3-VI, can be used to treat diseases and disorders associated with increased apoptosis and for treating inflammatory

Claim 2; Fig 1, 2; 50pp; Japanese.
The invention provides nucleotide sequences encoding death domain containing receptor polypeptides DR3-V1 and DR3. The DR3-V1 cDNA clone is contained in ATCC deposition No. 97456 and the DR3 cDNA clone is contained in ATCC deposition No. 9757. Recombinant vectors comprising the nucleic acid sequences and optionally the leader sequences are used for the recombinant production of the proteins. The present sequence represents a cDNA encoding the death domain containing receptor polypeptide (DR3-V1).

This sequence encodes the mouse apoptosis inducing receptor (AIR) of the invention. AIR is a Type I transmembrane protein, soluble forms of which can be used to regulate cell death in a therapeutic setting. Soluble AIR can also be used in vitro to block apoptosis or AIR-expressing cells, or to screen agonists or antagonists of AIR activity. The cytoplasmic domain of AIR can be used to develop assays for inhibitors of AIR-induced cell death, which is useful to regulate cell death in a therapeutic setting as well as in vitro. Agonists of AIR activity can be used to kill tumour cells that express AIR, or T cells expressing AIR in autoimmune diseases. Sequence 1251 BP; 224 A; 390 C; 375 G; 262 T;

CDNA clone 18.1 (ATCC 97493) codes for a novel polypeptide (see CDNA clone 18.1 (ATCC 97493) codes for a novel polypeptide (see CDNA clone 18.1), that can be was isolated from a human thymus cDNA library by screening with probes (see T91181-82) based on an EST sequence (GenBank locus probes (see T91181-82) based on an EST sequence (GenBank locus 414522) that showed homology to human Fas/Apo-1. The clone encodes an Apo-2LI polypeptide that is identical to amino acid residues to an apo-2LI polypeptide that is polypeptide, Apo-3 (see W26709), but appears to represent a naturally-occurring mRNA. Nucleic acids encoding Apo-3 (see T91180) or Apo-2LI can be used diagnostically for tissue-specific typing and can be used to produce the recombinant polypeptides including chimeric molecules comprising polypeptides fused to heterologous amino acid sequences.

The sequences given in 049931-32 encode human tumour necrosis fact receptor (TNF-R) and the sequences in 049933-34 encode human interleukin-1 receptor (IL-IR). These sequences were used in the production of a fusion protein which conformed to one of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; tumour necrosis factor receptor; TNF-R; interleukin-1 receptor; IL-1R; fusion protein; linker; TNF; IL-1; cachexia; cerebral malaria; rheumatoid arthritis; diabetes; multiple sclerosis; septic shock; pulmonary fibrosis; silicosis; allograft; xenograft; rejection;
                                                                                                                                                                                                                                                                                                                   The linker may comprise 5-100 amino acids selected from Gly, Asp, Ser, Thr and Ala. These linkers separate the individual moeities by such a distance that each component of the fusion protten is capable of folding into the secondary or tertiary structure required for its biological activity. These fusion proteins may be used in therapy, diagnosis and assays for conditions mediated by TNF or IL-1, particularly in conditions in which both TNF and IL-1 play a causitive role. They may be used to treat cachexia, rheumatoid arthritis, cerebral malaria, allograft and xenograft rejection in graft verses host disease, sepsis, septic shock, inflammation, allergies and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    TNF-R-linker-TNF-R-linker-TL-1R

Disclosure; Fig 1; 25pp; English.
The sequence is that of DNA encoding tumour necrosis factor alpha binding protein which was obtd. from a human placental cDNA library in lambda gtll using a probe (020974). The DNA also encodes the extracellular domain of human TNF alpha receptor and as such it is useful for treating diseases where TNF alpha is involved as a causative agent, e.g. cachexia, sepsis and autoimmune diseases, specifically rheumatoid arthritis. See also Q20974.

treating autoimmune disease, septic shock, HIV etc.

Claim 4; Fig 1; 43pp; English.

This sequence encodes human TNF-alpha 55kD receptor . A placenta cDNA library in 9t10 was screened with probe Q29236. Ten hybridising clones were plaque purified and cDNA size determined by PAGE against an Eco RI digested phage DNA. The inserts of two cDNA clones were then sequenced. The coding region of the majority of the human TNF-alpha C5kD receptor was isolated as an EcoRI fragment encoding 374 amino acids, and cloned into a mammalian cell expression vector, resulting in prTNFR. A derivative of the TNF-alpha receptor was produced by engineering a termination codon just prior to the transmembrane domain. PCR with primers Q29237,8 generated a 300bp restriction fragment which was cloned into prTNFR, giving pTNFRecd. DNA sequencing confirmed this contained the designed DNA sequence. The TNF-alpha receptor expression plasmids were then transfected into monkey COS-7 cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches

Claim 4; Fig 1; 26pp; German.
Partial amino acid sequences were determined for the 55 and 75kD
Partial amino acid sequences were determined for the 55 and 75kD
Partial amino acid sequences were used
TNF-BPs (see R11072-R11081) and oligonucleotide primers were used
synthesised based on these partial sequences. The primers were used
to produce a cDNA fragment for use as aprobe to screen a human
to produce a cDNA constructed in lambda gtll. Positive clones were
placental cDNA bank constructed in lambda gtll. Positive clones were
placental cDNA bank constructed in lambda gtll. Positive clones were
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 identifed and sequenced. DNA constructs comprising the TNF-BP coding sequence may also contain a fragment encoding a human Ig domain. Recombinant constructs are used to transform cells to confer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    31-AUG-1990; 116707.

The Tumour Necrosis Factor Binding Protein I is the soluble form o type I TNF-receptor and constitutes a fragment of the cell surface form of this receptor, corresp. to its extracellular domain. There is no characteristic poly(A) addition signal near the 3' end of the cDNA. The sequence ACTAAA (tag m) may serve as an alternative to this signal, but with low efficiency. See also Q12212-15.

Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was pCR-amplified cDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. clones 297480-302087, 682632-687239, 726408-728711, and 729096-731399. Subtraction by Bento Soares and M. Fatima Bonaldo. "
